**Abstract**
We propose technologies of creating digital twin of the world including people’s consciousness and activities. Additionally, we apply multilayer simulation technology while automatically selecting the necessary simulation layers from numerous layers. By these technologies, we aim to present actions that will lead to a better future.

**Features**
- Build a digital society by capturing human behavior from both "space" and "ecosystem"
- Visualize the multi-layered transformation of society by applying multi-layer simulation

**Application Scenarios**
- Visualize information during a disaster to deliver materials in proper proportion
- Propose traffic congestion reduction measures by simulating various traffic conditions

**Roadmaps**
- Based on the spatio-temporal data management knowledge we obtained in the examination of "space", we will advance research on "ecosystems" and establish an original multilayer simulation technology.

**Exhibitors**
