Abstract
We are developing a highly efficient and secure data hub that realizes sharing various distributed data managed by different organizations. By building a platform that enables users to quickly use the data they need while maintaining the data governance of its providers, safe and convenient data utilization across organizations can be achieved.

Features
- Secure cross-organizational data sharing while maintaining provider's data governance
- Users can use ubiquitous data with different locations and qualities in a unified manner

Application Scenarios
- Share only analysis results of sensitive data in the value chain (CO₂ emissions, etc.)
- Automatically extract only the necessary data from huge sensor data with different quality

Roadmaps
- We are working on integration with new ICT infrastructure technologies that realize the IOWN concept, and are aiming for early commercialization by collaborating with customers in actual projects.

Exhibitors
NIPPON TELEGRAPH AND TELEPHONE CORPORATION
