Mintent (Intent AI mediator)

Increase engagement with intent-driven services

Abstract

This technology derives the amount of resources that satisfy the intentions of service providers and users, and mediate the control of cloud servers, networks, and applications to enable services with high engagement (service KPI). In this exhibition, we will demonstrate this technology for video streaming and web conferencing.

Features

- Optimize the amount of resources using the relationship between intent and resources
- Improve engagement between service providers and users by intent-based mediation control

Application Scenarios

- Derive the optimal network route to maintain video-streaming intent during congestion
- Derive the amount of server resources that satisfy the intent of the web conference

Roadmaps

- Through field trials in collaboration with network and service providers, we aim to extend this technology and expand it to other services.
