

"Self-as-We" balances well-being and outcomes in groups

Background

In social groups such as workplaces and schools, we believe that not only individual well-being but also "Social Well-being" (well-being as a society), in which individual autonomy and group harmony are balanced, is important.

Summary

Based on the key concept of "Self-as-We", we will establish technologies and methodologies to support and measure the relationships between individuals and between individuals and groups. These will contribute to both individual well-being and the creation of group outcomes.

Feature 1

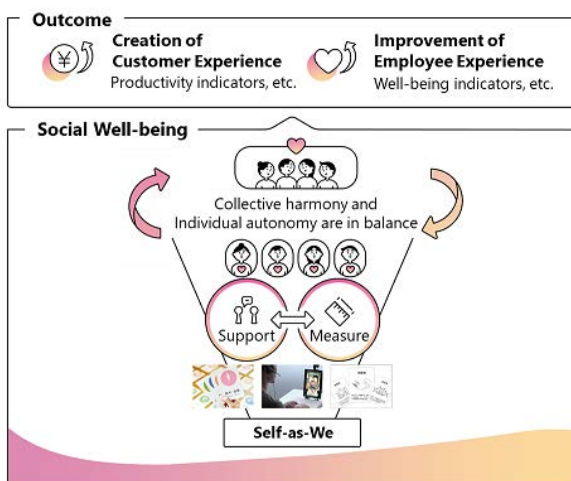

Supporting the co-creation of groups through dialogue and consensus-building tools and processes based on the values of well-being

Feature 2

Supporting co-creation of groups beyond distance by using multi modal communication and transaction technologies

Feature 3

Measuring the state of a group by considering the each member's degree of Self-as-We and the quality of the relationships within the group

Future benefits

We update workplaces, schools, local communities, and other places of daily life into places where diverse people can co-create goals and new ways of being through dialogue, and where well-being is sustained.
